

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Currently Amended) A vehicle equipped with a power output device that is capable of outputting a driving force to a drive shaft linked with drive wheels, said vehicle comprising:

a mechanical braking device that is capable of applying a mechanical braking force to said vehicle;

a slip detection module that detects a slip caused by spin of the drive wheels;

a running direction setting module that sets a running direction of said vehicle;

a slip-down detection module that detects vehicle speed in a reverse direction, which is reverse to the running direction of said vehicle set by said running direction setting module, thereby detecting a reverse run of said vehicle in the reverse direction and a slip-down of said vehicle;

a balancing force setting module that sets a balancing force, which balances with a force acting in a direction of the slip-down of the vehicle, based on a relation between an acceleration of said vehicle and the driving force output to the drive shaft; and

a controller that actuates and controls said power output device to restrict the driving force output to the drive shaft in response to detection of a slip by said slip detection module, said controller actuating and controlling said mechanical braking device to apply a mechanical braking force determined based on the set balancing force and the detected vehicle speed in the reverse direction to said vehicle in response to detection of a slip-down of said vehicle by said slip-down detection module under restricting the driving force output to the drive shaft.

2-3. (Canceled).

4. (Currently Amended) A vehicle in accordance with claim [[3]]1, wherein said controller actuates and controls said mechanical braking device to make the vehicle speed in the reverse direction approach to a preset vehicle speed.

5. (Previously Presented) A vehicle in accordance with claim 1, said vehicle further comprising:

a road surface gradient measurement estimation module that either measures or estimates a road surface gradient,

wherein said controller actuates and controls said mechanical braking device to apply a braking force corresponding to the measured or estimated road surface gradient.

6. (Currently Amended) A vehicle in accordance with claim 5, ~~said vehicle further comprising:~~

~~a running direction setting module that sets a running direction of said vehicle,~~

~~wherein said slip-down detection module includes a vehicle speed sensor that measures a vehicle speed in the reverse direction to the running direction of said vehicle set by said running direction setting module;~~

wherein said road surface gradient measurement estimation module estimates the road surface gradient according to ~~[[a]]the~~ relation between ~~[[an]]the~~ acceleration of said vehicle and the driving force output to the drive shaft, and

~~said controller actuates and controls said mechanical braking device to apply a braking force corresponding to a product of a balancing force, which balances with a force acting in a direction of the slip-down of the vehicle based on the relation between the acceleration of said vehicle and the driving force output to the drive shaft, and wherein the braking force is based on~~ a ratio specified according to the measured vehicle speed in the reverse direction.

7. (Original) A vehicle in accordance with claim 6, wherein said controller actuates and controls said mechanical braking device to make the vehicle speed in the reverse direction approach to a preset vehicle speed.

8. (Previously Presented) A vehicle in accordance with claim 1, wherein said mechanical braking device comprises a brake that applies a mechanical braking force to driven wheels, which are different from the drive wheels.

9. (Currently Amended) A control method of a vehicle, said vehicle being equipped with a power output device that is capable of outputting a driving force to a drive shaft linked with

drive wheels, and with a mechanical braking device that is capable of applying a mechanical braking force to said vehicle, said control method comprising the steps of:

- (a) detecting a slip caused by spin of the drive wheels;
- (b) actuating and controlling said power output device to restrict the driving force output to the drive shaft, in response to detection of a slip in said step (a);
- (c) detecting a slip-down of said vehicle by detecting vehicle speed in a reverse direction to a running direction set by a running direction setting module;
- (d) setting a balancing force that balances with a force acting in a direction of the slip-down of the vehicle, based on a relation between an acceleration of the vehicle and the driving force output to the drive shaft; and

[[((d))](c) actuating and controlling said mechanical braking device to apply a mechanical braking force to said vehicle, in response to detection of a slip-down of said vehicle in said step (c) under restricting the driving force output to the drive shaft in said step (b), wherein the braking force is determined based on the set balancing force and the detected vehicle speed in the reverse direction.

10. (Previously Presented) A vehicle in accordance with claim 1, wherein said power output device includes an electric motor that is capable of outputting power from said drive shaft.

11. (Withdrawn) A vehicle in accordance with claim 10, wherein said power output device comprises: an internal combustion engine;

a three-shaft power input output module that is connected with three shafts, that is, an output shaft of said internal combustion engine, said drive shaft, and a third shaft and, when powers input into and output from any two shafts among the three shafts are specified, determines power input into and output from a residual shaft, based on the specified powers;

a generator that is capable of inputting and outputting power from and to said third shaft.

12. (Withdrawn) A vehicle in accordance with claim 10, wherein said power output device comprises: and internal combustion engine; and

a pair-rotor motor having a first rotor, which is linked with said output shaft of said internal combustion engine, and a second rotor, which is linked with said drive shaft and relatively rotates through electromagnetic interaction between the first rotor and the second rotor.
